

Amendments to the Claims:

1. (Currently Amended) An apparatus for making foundation walls having angled or arcuate contours comprising:

first and second connecting members, each defining at least one joining portion, each of said first and second connecting members defining a channel for slidably receiving an end of a foundation form being couplable to an end of a foundation form so that when said forms are operably positioned adjacent to one another said joining portions defined by each of said connecting members interlock with one another;

each of said first and second connecting members defining a plurality of T-shaped slots to allow said first and second connecting members to be slidably attached to said foundation forms via pre-installed fasteners projecting outwardly from said foundation forms, each of said T-shaped slots extending completely through at least one surface of said first and second connecting members;

each joining portion defines a shaped passage extending there through, said shaped passage being substantially coaxial with one another when said first and second connecting members are operably positioned;

an elongated coupling member defining an exterior shape complimentary to a shape defined by said shaped passages is slidably received in said shaped passages thereby rotatably and releasably joining said first and second connecting members and thereby said foundation forms together.
